SUMMARY FOR THE MONTH OF JUNE, 1918.

Anticyclonic pressure prevailed from the 1st to the 10th, and accounted for fair and mild weather generally during this period.

From the latter date until the end of the month westerly depressions were extremely persistent, and the weather proved very unsettled, with considerable rainfall.

A notable meteorological feature was a remarkable tendency for the development of secondary "lows," and in consequence electrical disturbances frequently occurred in different parts of the country, more especially over the North Island.

On the last day of the month a shallow depression was centred westward of Cook Strait, and was responsible for a serious snowstorm in the North Canterbury district.

Except in the East Coast districts of the North Island and the west coast of the South, the total rainfall for the month was everywhere above the average.

D. C. BATES, Director.
