

Between the 3rd and the 6th a cyclone moved down from the north on to New Zealand, becoming more extensive in the process. This storm produced general rains which were of very great value to the country. The heaviest fell on the 5th when the storm was in the form of an irregular cyclone covering the central portion of the Dominion. The principal wheat-growing areas of Canterbury received between 2½ and 5 in. Large amounts were recorded also in eastern Otago and in Hawke's Bay. In the latter district there were heavy thunderstorms. Though cold weather followed it, and there was snow on the high levels, especially in Canterbury, the rain was a fairly mild one. North Auckland had heavy rain in the early part of this storm.

About a week later, on the 11th to 12th, another depression caused widespread rain, Canterbury again having heavy falls. This depression was of the westerly type, but a cyclone developed in its northern portion.

The third storm system occurred between the 20th and 24th. Following the passage of a westerly depression on the night of the 20th, a series of cyclones developed over the northern part of the Tasman Sea and passed to the north of the Dominion. Rains were again fairly general, but the parts principally affected were the northern and eastern portions of the North Island. From the morning of the 22nd cold southerly or south-easterly winds prevailed over the greater part of the country.

A somewhat similar type of weather was experienced from the 27th to the 30th, but on this occasion there was very little rain in the South Island and the cold was much less severe.

EDWARD KIDSON, Director.

CLIMATOLOGICAL TABLE.
MEANS AND TOTALS FROM CHIEF STATIONS.
November, 1933.

Altitude above Sea-level.	Name of Station and Observer.	Extremes.				Altitude above Sea-level.	Name of Station and Observer.	Extremes.
