## FOURTH SOHEDULE.

Computation of Premtums.

1. The amount of the premium payable on the conversion of any exiating securities shall be equal to the product obtained by multiplying the following factors, namely :-
(a) The difference between one year's interest on the amount of principal secured by the existing securities at the rate payable thereon immediately before the date of conversion and one year's interest on the same amount at the rate payable on the new securities; and
(b) The appropriate factor specified in the Table of Factors hereinafter set out, according to the period between the date of conversion and the maturity date of the existing securities.
2. For the purpose of computing any such period as is mentioned in paragraph (b) of the last preceding clause, any fraction of a half-year that is not less than three months shall be counted as a half-year, and any such fraction that is less than three months shall not be taken into account.

## Example of Working.

Conversion as from 15th December, 1933, of 6-per-cent. securities for $£ 100$, maturing 14th January, 1947, into $4 \frac{1}{4}$-per-cent. securities.

Interest rate on existing securities (as reduced by Part I of the Act) is 44 per cent. per annum.

Period from date of conversion (15th December, 1933) to existing maturity date (14th January, 1947) is 13 years 30 days, counted as 13 years.

Factor for 13 years is $9 \cdot 761556$.
$£ 0.55$ multiplied by 9.761556 is $£ 5 \cdot 3688558$, or $£ 57 \mathrm{~s}$. 4 d ., which is the premium for $£ 100$ of the existing securities.

The premiums on other amounts of existing securities of the same class can be computed in the same way, or, alternatively, by ascertaining $5 \cdot 3688558$ per cent. of the amount of the principal in each case.
